

# Visualizing Natural Disasters in the United States

This project aims to visually explore the impact of natural disasters in the United States using Tableau. By analyzing historical data, we will uncover trends, patterns, and insights into the frequency and severity of natural disasters, their effects on different states, and the associated human and economic costs.

## Project: -

Introduction: Overview of natural disasters in the USA and their impact on society and the environment. Visualizations showing the frequency and distribution of natural disasters in the USA over time and across states. Analysis of the severity of different types of natural disasters in the USA and their socio-economic impacts on different states. The following links have the datasets we are going to use for the visualization

[Federal Emergency Management Agency \(FEMA\)](#): - Through this website, we will get information about the disasters that have occurred in the United States.

[National Centers for Environmental Information \(NCEI\)](#): - Through this website, we can get the information about the climate and weather reports in the United States. These datasets can provide additional context and insights into the relationship between climate change and natural disasters.
